

# Top Contributors

---

On our index.html, we want to display a list of top contributors, they would be dynamically generated based on the number of answers each user has created.

## Update View

Update our question list as follows -

```
top_contributors =  
User.objects.annotate(num_answers=Count('answer')).order_by('-  
num_answers')[:5]
```

And pass the data as context to our template. Finally we will update index.html to display the users correctly.
