Bootstrap via Static

In the earlier chapters we used bootstrap by adding a CDN link, now we will be serving it using our local server.

We have already created a structure for static files in the previous sections, now let's start populating different parts of the project.

Adding bootstrap

Start by downloading bootstrap and its dependancies and place them in our static folder.

Start 'djora' app -

```
$ python manage.py startapp djora
```

Add the app to our settings and setup the basic views, templates and urls.

Templates

```
{% load static %}
```

Notice, we have added the above line at the beginning of our **'_base.html'**

Add the path to our **css** files using **static** -

```
<link rel="stylesheet" href="{% static 'vendor/css/bootstrap.min.css' %}"
/>
<link rel="stylesheet" type="text/css" href="{% static 'css/main.css' %}"
/>
```

Add **javascript** files at bottom -

```
<script src="{% static 'vendor/js/jquery-3.3.1.min.js' %}"></script>
<script src="{% static 'vendor/js/popper.min.js' %}"></script>
<script src="{% static 'vendor/js/bootstrap.min.js' %}"></script>
```
